

Mr. MoneyBags v1.x

Installation Guide – Ubuntu 24.04 LTS Guest in VirtualBox (Windows / macOS Host)

Document version 1.x – August 2025

1 Overview

This guide walks through a **clean installation** of Mr. MoneyBags v1.x inside an Ubuntu 24.04 LTS virtual machine (VM) running under Oracle VM VirtualBox.

The procedure matches the **working macOS reference environment** (Node.js 18, PostgreSQL 16, Express 5) and leverages the project's cross-platform automation scripts.

2 Prerequisites & Host Requirements

Component	Minimum	Recommended
Host OS	Windows 10/11 or macOS 13+	—
CPU	4 physical cores with VT-x / AMD-V	6+ cores
RAM	8 GB	16 GB (allocate ≥ 6 GB to guest)
Disk	40 GB free	80 GB on SSD / NVMe
Software	Oracle VirtualBox ≥ 7.0, Ubuntu 24.04 Desktop ISO	—

Enable hardware virtualization in BIOS/UEFI before installing VirtualBox.

3 Create the VirtualBox VM

- 1. **Download software**
 - VirtualBox: <https://www.virtualbox.org/wiki/Downloads>
 - Ubuntu 24.04 ISO: <https://ubuntu.com/download/desktop>
- 2. **New VM**
 - Name `Ubuntu24-MrMoneyBags-v1x`
 - Type `Linux` → Version `Ubuntu (64-bit)`
 - Memory **6144 MB** • Processors **4 vCPU**
 - Disk **VDI**, dynamically allocated, **60 GB**
- 3. **Tweaks**
 - Display → Graphics Controller **VBoxSVGA**, enable **3-D Acceleration**
 - Network Adapter 1 → **Bridged** (preferred) or **NAT**
 - Storage → attach the Ubuntu ISO.
- 4. **Install Ubuntu**
 - Normal installation, enable third-party codecs (optional).

Create user **fundadmin** (will have sudo).

After first boot:

```
sudo apt update && sudo apt -y upgrade
sudo reboot
```

4 Install Runtime Dependencies inside the VM

```
# Essential tools
sudo apt install -y git build-essential curl

# Node.js 18 LTS (via NodeSource)
curl -fsSL https://deb.nodesource.com/setup_18.x | sudo -E bash -
sudo apt install -y nodejs # node 18.x, npm 10.x+

# PostgreSQL 16 (official PGDG repository)
echo "deb http://apt.postgresql.org/pub/repos/apt $(lsb_release -cs)-pgdg main" | \
    sudo tee /etc/apt/sources.list.d/pgdg.list
curl -fsSL https://www.postgresql.org/media/keys/ACCC4CF8.asc | sudo apt-key add -
sudo apt update
sudo apt install -y postgresql-16

# Verify toolchain
node -v # v18.x
npm -v # 10.x+
psql -V # 16.x
```

5 Application Installation

5.1 Clone the Repository

```
sudo mkdir -p /opt && cd /opt
sudo git clone https://github.com/tpfbill/mr-moneybags.git
sudo chown -R $USER:$USER mr-moneybags
cd mr-moneybags
```

5.2 Create .env

```
cat > .env <<'EOF'
# Database
PGHOST=localhost
PGPORT=5432
PGDATABASE=fund_accounting_db
PGUSER=npfadmin
PGPASSWORD=npfa123

# Server
PORT=3000
EOF
chmod 600 .env
```

5.3 Install Node Dependencies

```
npm ci
```

Dependencies (excerpt from *package.json*):

- express **5.1.0**
- pg 8.16
- http-server 14.1
- concurrently 8.2

6 Database Setup

Option A (one-line, interactive)

Run the hardened Ubuntu helper script (idempotent):

```
scripts/setup-ubuntu-database.sh
```

Note All schema and data-load files live in the repository's top-level database/ directory (e.g. database/db-init.sql). The helper script already points there, but if you customise it ensure you **do not** prefix the path with scripts/.

The script:

1. Ensures PostgreSQL service is running.
2. Creates role **npfadmin** / **npfa123**.
3. Creates database **fund_accounting_db** owned by npfadmin.
4. Executes database/db-init.sql (consolidated schema with all tables and relationships).
5. Loads complete sample data via database/insert-complete-nacha-data.sql (vendors, NACHA settings, payment batches).
6. Writes/updates the .env file and verifies connectivity.

Option B (manual)

```
# 1. Create role & DB (cross-platform SQL)
sudo -u postgres psql -f database/setup-database-cross-platform.sql

# 2. Consolidated schema (creates all tables, relationships, constraints)
sudo -u postgres psql -d fund_accounting_db -f database/db-init.sql

# 3. Sample data (vendors, NACHA settings, payment batches)
sudo -u postgres psql -d fund_accounting_db -f database/insert-complete-nacha-data.sql
```

7 Run the Application

Open **two terminals** or use `npm run dev`.

```
# Terminal 1 – REST API (port 3000)
node server-modular.js

# Terminal 2 – Static front-end (port 8080)
npx http-server . -p 8080 --no-cache
```

Helper scripts:

```
npm run client    # only front-end
npm run dev       # backend + frontend concurrently
npm start         # backend only (same as node server-modular.js)
```

Browse to <http://localhost:8080/index.html>.

8 Testing & Verification Checklist

Test	Steps	Expected
API health	<code>curl http://localhost:3000/api/health</code>	<code>{"status":"ok"}</code>
Dashboard	Open <code>/index.html</code>	Summary cards and charts render
Vendor Directory	<i>Vendor Payments</i> → <i>Vendors</i>	List shows, Add Vendor modal works
Payment Batch	<i>Vendor Payments</i> → <i>Batches</i> → <i>New</i>	Entity & Fund dropdowns populate
NACHA File	Create batch → Approve → Generate NACHA	.ACH file appears & downloads
DB inspection	<code>psql -d fund_accounting_db -c '\dt'</code>	15 tables incl. <code>payment_batches</code> , <code>nacha_files</code>

9 Troubleshooting

Symptom	Resolution
"DB offline" badge	<code>sudo systemctl restart postgresql</code> and verify <code>.env</code>
Port 3000 in use	<code>sudo lsof -i:3000 → kill <PID></code>
Empty dropdowns (batch modal)	Run <code>database/insert-complete-nacha-data.sql</code> & restart API
CSS not updating	Hard-refresh (Ctrl-F5) or <code>--no-cache</code> flag
Script permission denied	<code>chmod +x scripts/setup-ubuntu-database.sh</code>

10 Performance Tips

1. Allocate extra vCPU/RAM to the VM.
2. Enable **Nested Paging & KVM Paravirtualization** in VirtualBox.
3. Store the VDI on an SSD/NVMe host drive.
4. Tune PostgreSQL (`shared_buffers = 512MB`, `work_mem = 16MB`).
5. Use **Bridged** networking for faster host↔guest transfers.

11 Security Considerations

- Change default passwords (npfa123) before production.
- Keep `.env` file **chmod 600** and outside version control.
- Enable UFW:

```
sudo ufw allow 8080/tcp
sudo ufw allow 3000/tcp
sudo ufw enable
```

- Regularly apply `apt upgrade` and PostgreSQL minor updates.
- Snapshot the VM after successful installation.

12 Appendix A – Useful Commands

```
# Stop both services
pkill -f http-server
pkill -f node

# Backup the database
sudo -u postgres pg_dump -Fc fund_accounting_db > fundacct_$(date +%F).dump

# Restore
sudo -u postgres pg_restore -d fund_accounting_db -c fundacct_2025-07-22.dump

# Refresh schema and sample data
psql -U npfadmin -d fund_accounting_db -f database/db-init.sql
psql -U npfadmin -d fund_accounting_db -f database/insert-complete-nacha-data.sql
```

Enjoy your fully-functional Mr. MoneyBags v1.x on Ubuntu 24.04!

For details on API endpoints and data model, see the in-app **Documentation** tab or README.md.
